

PRODUCTION TIMING Management Systems

Are you paying your staff to work... or simply to be at work?

The job you just completed – was it profitable? Is your company making money on labour, or haemorrhaging it? Can you accurately measure how long it takes to complete a job? Can you cut back on overtime... but still increase productivity?

Most companies have a pretty good idea of the cost of materials before they begin manufacturing their products – but have no accurate way of forecasting the time required for the various tasks to complete the job. How can you stay competitive if you don't know how long it will take to complete the project?

Many companies still *guesstimate* timings, either over-quoting and losing the job, or under-quoting and, at best, breaking even on a project.

Now there is a way to manage production timing.

**And, what's more, it's accurate, efficient...
and very affordable.**

The Production Timing Management System (PTMS) from Sentri Systems allows you to monitor budgeted time spent versus actual time spent on jobs, serving as a tool to dramatically increase productivity and profit margins.

PTMS enables you to optimise your most valuable resource, your employees. This system requires employees to account for their time, while allowing you to address issues such as additional operator training requirements, faulty machinery, delays in supplying spares... and every other possible reason for timing overruns.

PTMS offers you a solution to your timing and staffing inadequacies. It enables you to increase accuracy of quoting in the future by tracking, monitoring and analysing reports now. Your business can now make better management decisions, thereby increasing productivity, and reducing overheads, costs and wasted time.

PRODUCTION TIMING Management Systems

HOW DOES PRODUCTION TIMING MANAGEMENT WORK?

This PC-based network system uses touchscreens and barcode scanners for simplicity. Each employee is allocated their own unique number. The employees use the system to clock in and out for time and attendance purposes as required by law. However, the primary use is for workers to clock on and off of every job using barcoded labels for job numbers and task numbers. These are easily scanned into the system after activating the touch screen. The system uses specific codes for separate tasks, allowing the process to be tracked in detail from start to completion, including all reasons for stoppages during the process.

The PCs that are used to enter in all this information are strategically located on the shop or warehouse floor. All the PCs are linked to the server. The system operator can use one PC to enter jobs onto the system, which are only closed once they're invoiced; the production director or workshop manager can monitor progress on a second PC, while a third PC, in-store, instantly reflects what jobs are awaiting spares, enabling prompt responses and decreasing time wasted waiting for parts.

The system can instantly provide detailed reports on job status, time allocated to an employee, excess time, daily exceptions and over-budgeted jobs.

WHAT'S IN IT FOR YOU?

The Production Timing Management System pays for itself by increasing your productivity and efficiency. By comparing the hours being paid to staff for being at work versus the hours actually working on jobs, you can reduce the amount of overtime, therefore saving you money: an extremely valuable tool. With this system, you can increase productivity by between 5 – 15%, a tremendous increase which leads to tangible benefits. (Think what that is worth!) So PTMS will reduce your overheads, and not increase them!

Highlighting the status of all jobs allows you to keep your finger on the pulse, while eliminating the risk of lost paperwork. You can resolve guarantees and reworking swiftly and efficiently – jobs that have exceeded the hours allocated can be investigated and action taken to resolve the cause.

PTMS is all about accurate, efficient time measurement – if you cannot measure, you have no control.

WHO ARE WE?

The Production Timing Management System has been designed and developed by Senti Systems, the manufacturers of the market-leading productivity-enhancing software, TurboTime.

During the past 15 years, Senti Systems has become a leader in the fields of time, attendance and production timing management systems. We're directly responsible for calculating and paying the wages of in excess of 50 000 employees every week, and our solutions include accurate, reliable, easy-to-use software crucial to dealing with staff wages and production timing management.

If you'd like to know more about how Senti Systems can cut your costs and boost your productivity, get in touch with us today.
